

JUMP STRATEGY

The jump strategy is when you use a number line to jump in tens and ones to arrive at the answer.

$$32 - 25 = 7$$

SPLIT STRATEGY

The split strategy is when you split a number into parts and subtract each part separately. This is useful for large numbers.

$$61 - 34 = 27$$

SPLIT STRATEGY

The split strategy is when you split a number into parts and subtract each part separately. This is useful for large numbers.

$$61 - 34 = 27$$

COMPENSATION STRATEGY

The compensation strategy is when you round numbers in an equation to make it easier to solve in your head.

$$25 - 18 = 7$$

$$\begin{array}{r} 25 - 20 = 5 \\ 5 + 2 = 7 \end{array}$$

Rounded 18 up by 2 to make 20.

Add 2.
